

Victorian Marine Tapes Preservation Project

- Digitisation of VHS, 8mm, miniDV, and DVD tapes which record important baseline footage of the Victorian coast
- Recorded over a 20 year period, from the late 1990s-2000s
- To be made openly accessible in Deakin University's institutional repository

The Anglesea transect is now available, see dro.deakin.edu.au/view/DU:30122421

““The single most important reason to preserve this footage is so that we’re able to empirically document change. It’s very difficult to inform policy/management when there is no baseline to compare with present conditions. The digitised video will play a critical role in our ability to do that.”

Dr Alex Rattray
